

Supplementary Table S4. Results from Cox proportional hazards regression, with any or severe flare from week 24 through week 76 as the outcome and relative to baseline B cell % change through week 8, 24 or 24 adjusted for change from baseline through week 8 as the exposure in the pooled BLISS study population.

	HR	95% CI	P value	HR	95% CI	P value
	Any flare			Severe flare

Data are presented as the hazard ratio (HR), 95% confidence interval (CI) and P value. Percentage changes above the 97.5th percentile of the respective distribution were treated as outliers and were set to the value corresponding to the 97.5th percentile. Adjusted models included relative to baseline percentage changes for each one of the investigated B cell subsets, age, sex, ancestry, SLE disease duration, belimumab use, the interaction between belimumab use and cell changes, azathioprine use, mycophenolate mofetil or sodium use, methotrexate use, other immunosuppressant use (cyclosporine, oral cyclophosphamide, leflunomide, mizoribine or thalidomide) and BLISS study. One set of models with any flare from week 24 through week 76 as the outcome additionally included B cell subset percentage changes from baseline through week 8 among covariates. Significant P values are in bold.
