

Supplementary files - Elucidating the microbiome of the sustainable peat replacers composts and nature management residues

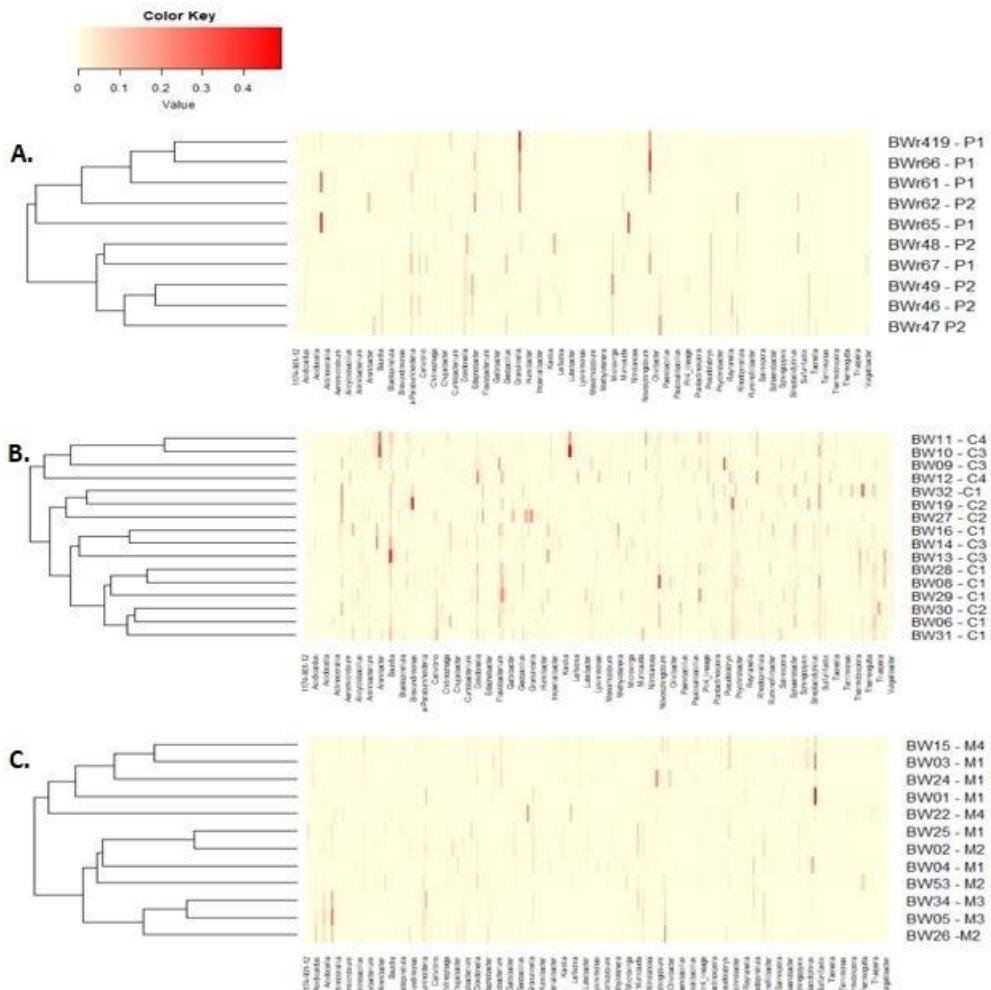

Steffi Pot, Caroline De Tender, Sarah Ommeslag, Ilse Delcour, Johan Ceusters, Bart Vandecasteele, Jane Debode, Karen Vancampenhout

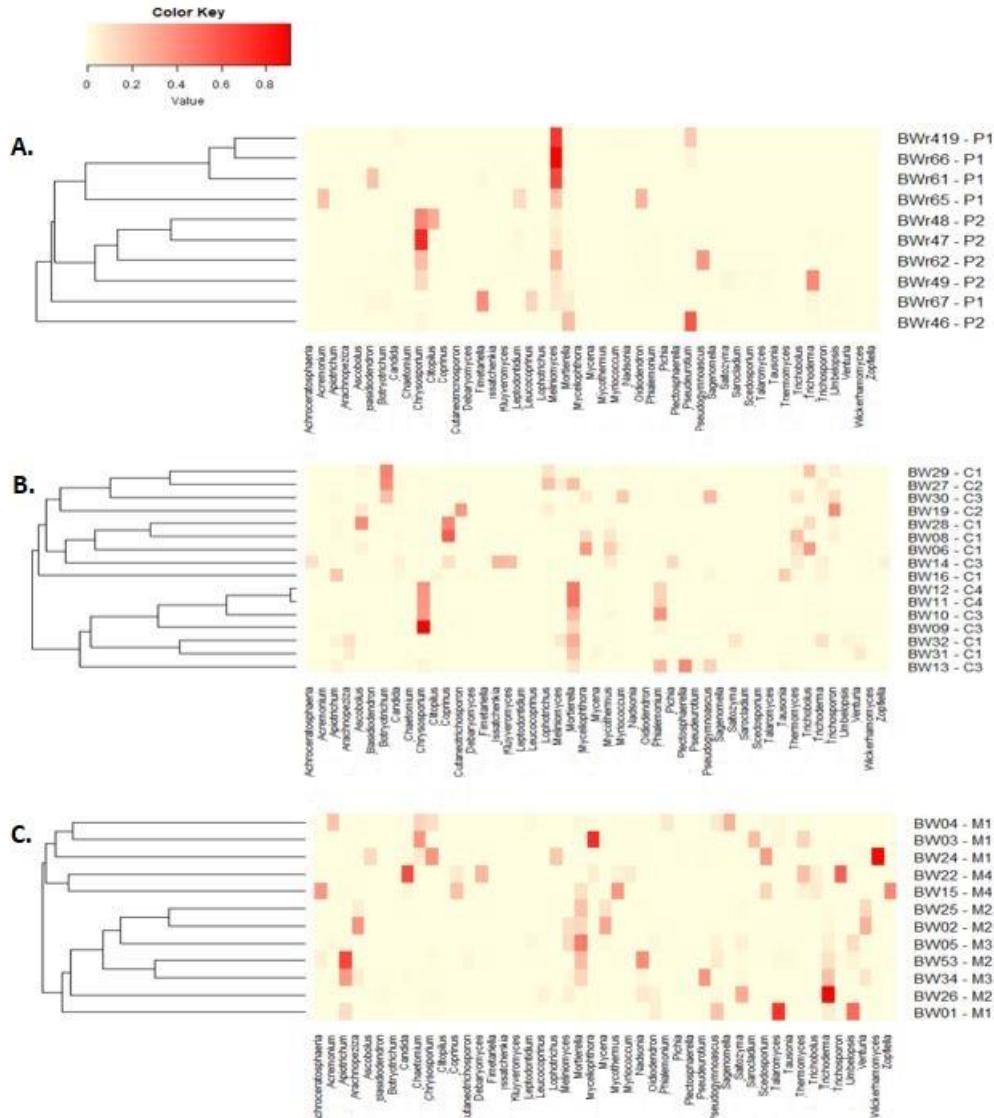

Supplementary Figure S1. Shifts in bacterial (A) and fungal (B) community composition between peat-based substrates, composts and management residues. Both figures represent Principal Coordinate Analysis (PCoA) profiles of pairwise community dissimilarity (Bray-Curtis) indices, based on either 16S V3-V4 rRNA gene or ITS2 gene sequencing data for bacteria and fungi respectively. Colours indicate the three different types of biomass.

Supplementary Figure S2. Shifts in bacterial and fungal community composition between subtypes in peat-based substrates, composts and management residues. Principal Coordinate Analysis (PCoA) profile of pairwise community dissimilarity (Bray-Curtis) indices of on the right, bacterial (16S V3-V4 rRNA gene), and on the left, fungal (ITS2) sequencing data of (A) peat-based substrates, (B) composts, and (C) management residues. Colours indicate the subtypes of peat-based substrates (P1-P2), composts (C1-C4) or management residues (M1-M4). P1 = pure peat-based substrates ($n = 5$); P2 = limed peat-based substrates ($n = 5$); C1 = green composts ($n = 7$); C2 = VFG composts ($n = 3$); C3 = woody composts ($n = 4$); C4 = peat composts ($n = 2$); M1 = grass clippings ($n = 4$); M2 = chopped heath ($n = 4$); M3 = forest sods ($n = 2$); M4 = woody fractions of composts ($n = 2$).

Supplementary Figure S3. Heatmap and clustering of the different samples of peat-based substrates (A), composts (B) and management residues (C) based on bacterial genera (16S V3-V4 rRNA gene) that showed a relative abundance of 1% in at least one sample. P1 = pure peat-based substrates ($n = 5$); P2 = limed peat-based substrates ($n = 5$); C1 = green composts ($n = 7$); C2 = VFG composts ($n = 3$); C3 = woody composts ($n = 4$); C4 = peat composts ($n = 2$); M1 = grass clippings ($n = 4$); M2 = chopped heath ($n = 4$); M3 = forest sods ($n = 2$); M4 = woody fractions of composts ($n = 2$).

Supplementary Figure S4. Heatmap and clustering of the different samples of peat-based substrates (A), composts (B) and management residues (C) based on fungal genera (ITS2) that showed a relative abundance of 1% in at least one sample. P1 = pure peat-based substrates (n = 5); P2 = limed peat-based substrates (n = 5); C1 = green composts (n = 7); C2 = VFG composts (n = 3); C3 = woody composts (n = 4); C4 = peat composts (n = 2); M1 = grass clippings (n = 4); M2 = chopped heath (n = 4); M3 = forest sods (n = 2); M4 = woody fractions of composts (n = 2).

Supplementary Table S1. Associations between bacterial (left) and fungal (right) community composition and chemical characteristics and biomass of microbial groups in (A) peat-based substrates, (B) composts, (C) management residues. Bold indicates a significant association. (x and y: respective coordinates on the PCoA plot in the PCoA1 and PCoA2 axes; r²: determination coefficient; EC: electrical conductivity, N_{min}: mineral N = NO₃-N + NH₄-N, OM: organic matter, DM: dry matter, P_{water}: water-extractable P, C_{water}: water-extractable C, N_{immob}: N immobilization, OUR: oxygen uptake rate)

Supplementary Table S5 Relative abundance of differential abundant bacterial (16S rRNA V3-V4) genera in the subtypes of management residues (M1-M4) as compared to the two subtypes of peat-based substrates (P1 and P2) that represent at least 1% in one of the subtypes. Asterisks indicate a significant difference in the relative abundance as compared to subtype P1 of peat-based substrates. Hashtags indicate a significant difference in the relative abundance as compared to subtype P2 of peat-based substrates. P1 = pure peat-based substrates (n = 5); P2 = limed peat-based substrates (n = 5); M1 = grass clippings (n = 4); M2 = chopped heath (n = 4); M3 = forest sods (n = 2); M4 = woody fractions of composts (n = 2).

Supplementary Table S6 Relative abundance of differential abundant fungal (ITS2) genera in the subtypes of composts (C1-C4) as compared to the two subtypes of peat-based substrates (P1 and P2). Asterisks indicate a significant difference in the relative abundance as compared to subtype P1 of peat-based substrates. Hashtags indicate a significant difference in the relative abundance as compared to subtype P2 of peat-based substrates. P1 = pure peat-based substrates ($n = 5$); P2 = limed peat-based substrates ($n = 5$); C1 = green composts ($n = 7$); C2 = VFG composts ($n = 3$); C3 = woody composts ($n = 4$); C4 = peat composts ($n = 2$); M1 = grass clippings ($n = 4$); M2 = chopped heath ($n = 4$); M3 = forest sods ($n = 2$); M4 = woody fractions of composts ($n = 2$).

Supplementary Table S8 Mean relative abundances \pm se of known antagonistic genera (*Bacillus*, *Burkholderia*, *Paenibacillus*, *Pseudomonas*, *Serratia*, *Streptomyces*, *Penicillium* and *Trichoderma*) in the subtypes of the three types of biomass. Asterisks indicate a significant difference in the relative abundance as compared to pure peat-based substrates (P1). Hashtag indicates a significant difference in the relative abundance as compared to limed peat-based substrates (P2). P1 = pure peat-based substrates (n = 5); P2 = limed peat-based substrates (n = 5); C1 = green composts (n = 7); C2 = VFG composts (n = 3); C3 = woody composts (n = 4); C4 = peat composts (n = 2); M1 = grass clippings (n = 4); M2 = chopped heath (n = 4); M3 = forest sods (n = 2); M4 = woody fractions of composts (n = 2).

Supplementary Table S9 Genera that were significantly more abundant in at least one of the subtypes of composts and management residues compared to peat-based substrates and that have been found in literature to include (A) biocontrol agents and/or (B) plant-growth promoting species.

Supplementary Figure S5. Principal component analysis (PCA) on carbon source metabolization determined with Biolog Ecoplates with subtypes of peat-based substrates, composts and management residues. Colors indicate different subtypes of peat-based substrates (P1-P2), composts (C1-C4) and management residues (M1-M4). The first two principal components (PC) presented 18.5% and 12.8%, respectively, of the total variability in the dataset. P1 = pure peat-based substrates ($n = 2$); P2 = limed peat-based substrates ($n = 1$); C1 = green composts ($n = 7$); C2 = VFG composts ($n = 3$); C3 = woody composts ($n = 4$); C4 = peat composts ($n = 2$); M1 = grass clippings ($n = 4$); M2 = chopped heath ($n = 4$); M3 = forest sods ($n = 2$); M4 = woody fractions of composts ($n = 2$).

Supplementary Figure S6. Metabolic characteristics in subtypes of peat-based substrates (P1-P2), composts (C1-C4) and management residues (M1-M4). AWCD (average well color development) of carbohydrates, carboxylic acids, amino acids, miscellaneous C-sources, polymers and amines/amides. P1 = pure peat-based substrates ($n = 2$); P2 = limed peat-based substrates ($n = 1$); C1 = green composts ($n = 7$); C2 = VFG composts ($n = 3$); C3 = woody composts ($n = 4$); C4 = peat composts ($n = 2$); M1 = grass clippings ($n = 4$); M2 = chopped heath ($n = 4$); M3 = forest sods ($n = 2$); M4 = woody fractions of composts ($n = 2$).

Supplementary Figure S7. Principal component analysis (PCA) on microbial biomass determined with PLFA analysis with subtypes of peat-based substrates, composts and management residues. Colors indicate different subtypes of peat-based substrates (P1-P2), composts (C1-C4) and management residues (M1-M4). The first two principal components (PC) presented 72.9% and 13.3%, respectively, of the total variability in the dataset. P1 = pure peat-based substrates ($n = 5$); P2 = limed peat-based substrates ($n = 5$); C1 = green composts ($n = 7$); C2 = VFG composts ($n = 3$); C3 = woody composts ($n = 4$); C4 = peat composts ($n = 2$); M1 = grass clippings ($n = 4$); M2 = chopped heath ($n = 4$); M3 = forest sods ($n = 2$); M4 = woody fractions of composts ($n = 2$).

Supplementary Figure S8. Mean net inoculation \pm se (log fg DNA/L) in the different subtypes of peat-based substrates, composts, and management residues. P1=pure peat-based substrates (n=5); P2=limed peat-based substrates (n=5); C1=green composts (n=7); C2=VFG composts (n=3); C3=woody composts (n=4); C4=peat composts (n=2); M1=grass clippings (n=4); M2=chopped heath (n=4); M3=forest sods (n=2); M4=woody fractions of composts (n=2).
