¹Department of Pedagogy of Higher Education, Kazan Federal University, Kazan, Russia, ²Department of Humanities, Financial University Under the Government of the Russian Federation, Moscow, Russia, ³Department of Pedagogy and Psychology, MGIMO University, Moscow, Russia, ⁴Department of Foreign Languages, Peoples' Friendship University of Russia, Moscow, Russia

This paper aims to provide a holistic overview of research trends examining online learning in higher education in BRICS countries, an acronym for an association of five major emerging economies: Brazil, Russia, India, China, and South Africa, after COVID-19 using bibliometric analysis. Researchers utilized VOSviewer's software to analyze the data using a bibliometric approach. 971 publications from the SCOPUS database were found appropriate for this research based on the inclusion and exclusion criteria. The results of the number of documents showed that there has been an increase in the amount of research on online learning in higher education in the BRICS countries. Also, the results showed that researchers from China and South Africa had the highest publications on online learning. However, researchers in Russia had very few publications. In addition, the co-authorship relationships among the BRICS countries revealed specific relationships of scholars with their colleagues from other countries. The results revealed that scholars from Indian and South African researchers had close collaborations, and Russian researchers did not have any collaborations with other countries. Finally, the results revealed two lines of research trends. The first line of research has focused on e-learning, online learning, students, and teaching. The second line of COVID-19 has focused on the pandemic, learning, online education, and students. Based on the results, recommendations are made for further research and higher education.

KEYWORDS

online learning, higher education, BRICS countries, bibliometric, distance education

Introduction

Online learning has become increasingly important in higher education, particularly during the COVID-19 pandemic. The transition to online learning was essential for higher education institutions to maintain the continuity of education (Dhawan, 2020). The sudden shift to online learning due to the pandemic has presented challenges for students and highlights the importance of adaptability and understanding the impact on learning experiences (Besser and Zeigler-Hill, 2022). Research shows that online learning has emerged as an essential tool for universities to deliver education on and off campus (Shahzad et al., 2020). In response to the challenges of the pandemic, higher education institutions have had

to address various aspects of online learning, such as integrating synchronous and asynchronous learning tools, ensuring technology access, and enhancing faculty and student online skills (Turnbull et al., 2021). Online learning has been crucial in enhancing the efficacy of education during the pandemic by offering students flexibility in terms of time and location (Li and Pei, 2023). Efforts have been made to promote online learning, with initiatives in developing countries (Yang et al., 2022). Quality assurance in online learning programs is crucial to ensure quality education in higher education (Hafeez et al., 2022). Online learning has become indispensable in higher education because it allows students to engage with course content, interact with instructors, and access educational resources conveniently (Zhu, 2021). The future of higher education is increasingly intertwined with online learning, which offers flexibility and accessibility to learners.

In the wake of the COVID-19 pandemic, online learning in higher education has faced issues such as the lack of interaction in virtual classrooms, inefficient use of internet technology, and limited ICT resources (Ozdamli and Karagozlu, 2022). Students and educators had to quickly adapt to online platforms, which raised concerns about the organization and delivery of online learning (Ali, 2020). The transition to online learning presented challenges regarding students' ability to adapt to online learning environments, known as online learning skills, which became essential during the pandemic (Koh et al., 2023). In addition, the global closure of educational institutions and the shift to online platforms due to the pandemic significantly impacted student engagement and academic resilience (Sartika and Nirbita, 2023). Although student satisfaction with online education increased in certain regions, challenges persisted, including unstable network signals, a lack of educational resources, and challenges in assessing educational quality (Mazurek, 2022; Zhang and Wu, 2022). The lack of face-to-face meetings and the transition to distance learning affected student satisfaction and engagement in online education. In addition, the COVID-19 outbreak accelerated the integration of digital technologies into education, but challenges such as limited practice opportunities, pedagogical deficiencies, and mental well-being issues also emerged (Mustapha et al., 2021; Ozdamli and Karagozlu, 2022). The pandemic also led to a reassessment of teaching methods and a shift to blended or hybrid forms of digital learning, which were expected after COVID-19 (Guppy et al., 2022). The sudden shift to distance learning during the emergency underscored the need for institutional capabilities to support students in designing online classrooms (Riddell et al., 2021; Morton and Durandt, 2023).

The significance of educational technologies in the shift from face-to-face to online teaching during the pandemic was underscored (Turnbull et al., 2021). The sudden shift to online instruction due to the pandemic resulted in extensive disruptions to higher education, underscoring its adverse effects (Ardissone et al., 2023). An analysis of research reports and case studies emphasized key issues in teaching and learning arising from the pandemic, focusing on activities in North American higher education and various countries (Bates, 2023). Studies (e.g., Mazurek, 2022; Ricardo et al., 2023) have also delved into students' perceptions of online education, noting increased satisfaction due to more frequent synchronous classes during the pandemic. The impact of challenges and advantages of online learning on academic performance was examined, assessing the readiness of academics and students to embrace emerging technologies (Kumar and Fernandez, 2022). Online learning was viewed as a potential post-COVID-19 pedagogical alternative for university students,

contributing to the existing literature on this subject (Sim et al., 2021). Overall, online learning trends in higher education post-COVID-19 have focused on challenges, technology, student perception, and the shift to online instruction. These studies offer valuable insights into the evolving landscape of online education in the aftermath of the pandemic.

Online learning in higher education in BRICS countries has garnered significant research interest. The COVID-19 pandemic has expedited the adoption of online teaching methods in these nations (Rababah et al., 2021). This transition has underscored the importance of aligning higher education systems within the BRICS framework (Zvereva et al., 2020). The potential for higher education institutions in BRICS countries to cultivate sustainability-oriented citizens has been emphasized, highlighting the necessity of evaluating higher education for sustainable development (Greyling et al., 2022). Moreover, the discourse on international collaboration in higher education within BRICS countries has been a focal point, stressing the significance of excellence and network building in this context (Khomyakov et al., 2020). Despite the momentum towards online learning, challenges and the efficacy of online education have been a subject of debate, with some studies suggesting that students encounter difficulties adapting to online learning, expressing a preference for traditional offline educational modes (Adnan, 2020). Furthermore, BRICS countries have underscored the role of education in economic development, acknowledging it as a fundamental driver for growth (Rodrigues, 2018). Research findings on online learning in higher education in BRICS countries illuminate these nations' evolving educational landscape, emphasizing education's pivotal role in fostering economic growth and societal well-being.

The emergence of the COVID-19 pandemic has irrevocably changed the landscape of higher education worldwide, and this shift is particularly pronounced in the BRICS countries (Brazil, Russia, India, China, and South Africa), which account for a significant proportion of the world's population and a substantial segment of global higher education. The importance of studying online learning in the BRICS countries post-COVID-19 stems from their unique socio-economic, technological, and educational contexts that influence the implementation and outcomes of digital learning. Online learning has evolved from a mere emergency measure to a fundamental component of higher education systems post-pandemic. It offers the potential to improve accessibility, inclusivity, and flexibility in education, qualities particularly important in the emerging societies of the BRICS countries. However, the rapid and sometimes unsystematic shift to online platforms has also exposed and exacerbated existing inequalities in access to technology, digital skills, and the quality of educational resources, raising critical concerns about the equity and effectiveness of higher education.

While there is a growing body of research on online learning globally, there are still some gaps in the context of BRICS countries, especially in the post-pandemic period. First, more comprehensive studies need to examine the long-term process of online learning models that were rushed into place during the pandemic. Secondly, the digital divide within and between the BRICS countries presents a multi-layered challenge that must be thoroughly addressed in the existing literature. The differences in technological infrastructure, internet access, and digital literacy of students and teachers in urban and rural areas and between different socio-economic groups may lead to differences in the development of equitable online learning

strategies. Third, the influence of cultural and contextual factors on the acceptance and effectiveness of online learning in BRICS countries may affect the success of online learning, including educational traditions, language barriers, teacher-learner dynamics, and institutional readiness for digital transformation. Fourth, there needs to be more gaps in empirical research on the policy frameworks and institutional strategies that support the shift to online learning in BRICS countries. By addressing these research gaps, this study aims to provide a nuanced understanding of the role of online learning for the future of higher education in the BRICS context and offer insights for policymakers, educators, and stakeholders to promote inclusive, effective, and resilient education systems in the post-pandemic world. In this parallel, using a bibliometric analysis, this paper aims to present a holistic review of research and research trends examining online learning in higher education in BRICS countries after COVID-19.

Research in the BRICS countries, which include Brazil, Russia, India, China, and South Africa, is essential. While the BRICS formation initially focused on macroeconomic interests, these nations are known for their growing involvement in science and technology, emphasizing the importance of collaboration to increase research productivity (Bornmann et al., 2015). In global governance, the BRICS countries are crucial in promoting economic development, especially during the COVID-19 pandemic (Vyas-Doorgapersad, 2022). Bibliometric analysis is a method of gathering formal and quantitative data about a particular situation. It analyzes the current visualization software and assists in tracking academic trends in the era of metrics. The ultimate goal of this approach is to provide quantitative information on research performance through data and numerical measurement indicators. Researchers across various fields use bibliometrics metrics to gain valuable insights into the productivity of countries, universities, authors, and strong research areas. Bibliometrics help identify literature gaps, potential opportunities, and collaborative networks and provide quantitative insights into the broad impact of research outputs. While bibliometrics has limitations, it can still be used as a preliminary review stage in any research and is widely considered one of the factors explaining interest.

Related literature

Extensive research has been carried out on online higher education in BRICS nations. The COVID-19 pandemic has expedited the uptake of online teaching methods in these countries. The pandemic has considerably affected the education systems of BRICS nations and has initiated a reassessment of conventional teaching approaches. For example, Greyling et al. (2022) emphasize the importance of integrating sustainable practices into higher education in BRICS countries to use education as a tool for sustainable development. Fauzi (2022) provided a comprehensive overview of e-learning in higher education institutions during the COVID-19 pandemic. The results showed that e-learning studies have increased significantly during COVID-19 in a short period of 2 years. Brika et al. (2022) provided a comprehensive bibliometric overview of research on e-learning in higher education during COVID-19. They used data from 602 studies for bibliometric review in the Web of Science database. This research identified various terms and subfields of e-learning in higher education.

Küçük-Avci et al. (2022) investigated the impact of COVID-19 on distance education in higher education. They used two data sets from the Web of Science database, covering the period before COVID-19 and after COVID-19. The terms “e-learning” and “online learning” were more commonly used after COVID-19 than before the pandemic. The research trend in the post-pandemic period mainly focused on topics like video lectures and Web 2.0 technologies. The findings indicated that COVID-19 significantly influenced research in the post-pandemic era, leading to a surge in interest in e-learning and online education in higher education. Bilal et al. (2022) conducted a bibliometric analysis of 1,595 studies from 589 journals published in 2020–2021. Their research aimed to evaluate the primary research trends in virtual learning during the COVID-19 pandemic. According to their findings, there are four primary trends in virtual learning: 1) Difficulties in online and blended learning approaches, 2) Student-centered, collaborative learning, and curriculum development, 3) Home laboratory learning, and 4) Teacher professional skills and interdisciplinary learning. The study of Tlili et al. (2022) investigated the impact of enrollment on research studies in scientific publications indexed by the Web of Science. They analyzed 108 studies using bibliometric mapping analyses to determine research trends in the countries contributing to Massive Open Online Courses research. During the COVID-19 pandemic, researchers observed a trend in the countries contributing to MOOC research. They found that researchers from China and Spain showed more interest in MOOC research, while those from the United States contributed literature. However, they also noticed that interest in MOOCs increased in countries less represented during the pandemic, such as Mexico, India, and Morocco. This is compared to countries that previously dominated the literature, such as the United Kingdom, the Netherlands, and Germany. Additionally, researchers found that factors affecting learner retention or completion rates and related issues such as self-regulation, motivation, intention, and goal orientation were the most frequently studied variables in MOOC research during the pandemic.

In a recent study, Zhang et al. (2022) conducted a comprehensive bibliometric analysis of research on online learning in higher education during COVID-19. They analyzed publications published from January 2020 to August 2021. The study revealed that researchers from 103 countries globally investigated various aspects of online learning during the pandemic, including the utilization of diverse technologies and strategies, curriculum redesign, student perspectives, and the psychological impacts of online learning. Researchers utilized technology acceptance theories and structural equation modeling to investigate the factors influencing the acceptance and effects of online learning during the pandemic. The disciplines of medical and chemistry education were the most extensively studied. Regarding teaching methods, inquiry-based learning, discovery learning, hands-on learning, and collaborative learning were the most commonly mentioned or employed. A study by Aristovnik et al. (2023) examined recent trends in online learning in higher education during the COVID-19 pandemic. The study utilized specific bibliometric methods and analyzed published works from January 2020 to March 2022 using the Scopus database. The research shows that the COVID-19 pandemic has increased interest in online learning research. The main discussion topics in online learning research during the pandemic were ICT and pedagogy, technology-enhanced education, student experience, mental health and wellbeing, and curriculum and professional development. Finally, the COVID-19

pandemic has pushed BRICS countries towards a more digital and sustainable future of higher education, necessitating a reassessment of teaching methods, governance structures, and their impact on economic development. The studies above contribute to a better understanding of the complex landscape of online higher education in many countries during the COVID-19 pandemic. However, a lack of research on online learning in higher education in BRICS countries using a bibliometric approach is obvious. Bibliometric studies in higher education, such as those by [Aristovnik et al. \(2023\)](#) and [Zhang et al. \(2022\)](#), have addressed research on online learning during the pandemic. No research has critically reviewed research and trends in BRICS countries. This paper aims to provide a comprehensive overview of research and trends analyzing online learning in higher education in BRICS countries post-COVID-19.

In addition to these studies, research has also focused on examining the effects of online learning on higher education students and faculty. For example, [del Arco et al. \(2021\)](#) examined the relationship between perceived quality during the lockdown period caused by COVID-19 and the variables curriculum, material resources, interaction processes, and the affective–emotional component in a study from the perspective of Spanish university students. They included students from 20 universities in Spain. Their results revealed that the quality of online teaching was directly related to provided resources and interactions between professors and students. However, their perceptions did not directly impact planning or the emotional state or effect induced by the unprecedented confinement situation. A study by [Almazova et al. \(2020\)](#) explored the challenges university teachers faced while adopting online learning, leading to the examination of their readiness for online teaching during the pandemic. The study included 87 higher education teachers who were asked to answer several questions describing their experiences with online teaching following the introduction of online teaching amidst the COVID-19 pandemic. Their analysis revealed that the main challenges faced by the university teachers were computer literacy, the university's e-environment and its support, academic staff readiness, and student readiness for online learning, with the latter being the biggest barriers to implementing an effective online teaching process. They also found that most respondents indicated that the methodological work of a teacher in a digital educational environment differs from traditional teaching methods.

[Lee et al. \(2021\)](#) aimed to understand institutional changes and their impact on faculty members' educational experiences during COVID-19. They collected data from scholars at a university in South Korea. The sudden change in institutional teaching activities and conditions caused scholars to face a dilemma due to contradictions. The study found that novice and expert online teachers faced different challenges. In another research, [Ramos-Pla et al. \(2021\)](#) analyzed the training of lecturers before and after the pandemic and their perception of its impact. Their results showed that training increased in institutional digital tools, online evaluation, and online course design. They also found that university professors invested a lot of effort in acquiring knowledge to implement the acquired knowledge, and they had higher perceptions of the impact of the training. In addition, they found that participants highlighted the lack of time to adapt their teaching practice to the acquired knowledge and the complexity of conducting an online evaluation as the biggest challenges. In another research, [Moorhouse and Kohnke \(2021\)](#) investigated the impact of distance learning in a learning environment and the requirement to

teach synchronously online via video conferencing software on the motivation of university lecturers in Hong Kong. They interviewed faculty members who had completed a full semester of emergency distance learning. The results showed that the academics fell into two different groups. The faculty members in the first group appeared to be thriving. They reported mainly positive effects of distance learning on their motivation, while others in the second group were just surviving and reported mainly negative effects. For the 'thriving' group members, the semester reinvigorated their teaching and provided them with new skills. Regarding members of the 'surviving' group, they mostly questioned their ability to teach, found it difficult to relate to learners, felt isolated, and struggled to find professional satisfaction.

Method

Data collection

In this research, we holistically analyzed the studies conducted on online learning in higher education in the BRICS countries using a bibliometric analysis approach. We retrieved relevant articles from the Scopus academic database for bibliometric analysis. The search terms included mainly variations of "online learning," "higher education," and "COVID-19." The detailed search terms for inclusion and exclusion criteria are given in [Table 1](#). In the literature, various terms are used interchangeably to refer to online learning in educational contexts. These synonyms include remote education, online education, virtual education, remote learning, e-learning, distance education, virtual learning, asynchronous learning, blended learning, networked learning, web-based learning, web-based training, learning objects, computer-assisted instruction, internet-based learning, computer-based learning, multimedia learning, technology-enhanced learning, and virtual learning environments ([Hamad, 2021](#); [Stevanović et al., 2021](#); [Kozak et al., 2023](#)). While distinctions between e-learning and online learning exist, some emphasize that online learning is primarily internet-based; the consensus is that these terms are often used synonymously ([Stevanović et al., 2021](#)). The search was limited to peer-reviewed journal articles and conference papers published within a specific period from 2020 to 2023 covering the pandemic after COVID-19. Publications that appeared in 2024 were not included in this research. All information about the included publications based on the search criteria was downloaded from the SCOPUS database for the bibliometric analysis. The information included bibliographic data, including title, authors, year of publication, journal, number of citations, authors' affiliation, and country of origin. We used VOSviewer software, one of the well-known programs for analyzing data. The search returned a total of 2064 documents in the first search. After filtering the publications on social sciences, the results drop to 1,192 documents. We later used a year of publication filter to search publications from 2020 to 2023. This reduced the results to 1,163 documents. After that, we used a filter option to include articles and conference papers. This reduced the number of publications to 1,005. Finally, we used another filter option to include publications in English. The final number of documents thus amounted to 971. [Figure 1](#) shows how the authors of this paper used the inclusion and exclusion criteria using the PRISMA flowchart ([Page et al., 2021](#)). Of these 971 publications, 804 were journal articles, while 167 documents were conference proceedings. The number of articles in the press was 52. The number of published articles was 919.

TABLE 1 List of keywords used in the research.

Main keywords	Specific keywords to search main keywords
Online learning	“online learning,” OR “online teaching,” OR “online education,” OR “on-line education” OR “on-line teaching” “on-line learning” OR “e-learning,” OR “e-instruction,” OR “virtual teaching,” OR “virtual learning,” OR “virtual education,” OR “distance learning,” OR “distance teaching” “distance education” OR “digital learning” OR “digital teaching” OR “digital education” OR “web-based training” OR “web-based education” OR “web-based teaching” OR “computer-based learning” OR “computer-based teaching” OR “computer-based education” OR “remote education” OR “internet learning” OR “remote learning” OR “remote education” OR “asynchronous learning” OR “blended learning” OR “blended teaching” OR “blended education” OR “networked learning” OR “computer-assisted instruction” OR “computer-assisted education” OR “computer-assisted teaching” OR “internet-based learning” OR “internet-based teaching” OR “internet-based education” OR “multimedia learning” OR “multimedia teaching” OR “multimedia education” OR “technology-enhanced learning” OR “technology-enhanced teaching” OR “technology-enhanced education” OR “virtual learning environments” AND
Higher education	“higher education,” OR “university students,” OR “undergraduate,” OR “graduate,” OR “master,” OR “doctoral student,” OR “Ph.D. student,” OR “doctoral program,” OR “postsecondary,” OR “master student,” OR “master program,” OR “covid-19,” OR “pandemic,” OR “coronavirus,” AND
BRICS countries	“Brazil,” OR “China,” OR “India,” OR “Russia,” OR “South Africa.” AND
Inclusion and exclusion criteria	Published in English language Article or Conference proceedings 2020–2023 (Published documents after the Covid-19 pandemic) AND
Search field	Article title, abstract, and keywords

Data analysis

Various bibliometric analysis tools are used in the literature. In this study, we preferred the VOSviewer program due to its strengths. It makes it easier for researchers to explore developments, relationships, and new concepts in the literature, which is considered an important program. In addition, it enables visualization and mapping, and, as it offers the possibility of multidimensional analysis, in-depth analysis of data sets enables the use of the SCOPUS database. We chose the SCOPUS database because it has search indicators and uses various search parameters to analyze published publications on a specific topic or research. It also allows comprehensive data collection from a wide range of disciplines. The bibliometric analysis involved analyzing the collected bibliographic data to identify trends, patterns, and the overall impact of research on online learning in higher education. This could include the creation of visualizations, such as co-authorship networks or citation maps, to identify influential authors and research clusters. The methodological approach in this research involved categorizing the collected data according to conducting bibliometric and descriptive analyses to understand the research trends.

Results

Numbers of publications by years

Table 2 illustrates the number of documents we found in the database on online learning in the context of higher education. The results show that 84 publications were published in 2020. In 2021, the number of documents increased to 287. In 2022, the highest documents were published on online learning in higher education. In 2023, the number of documents are 290. These results show that the number of documents in the last 3 years is close to each other. In particular, a higher number of publications was conducted in 2022.

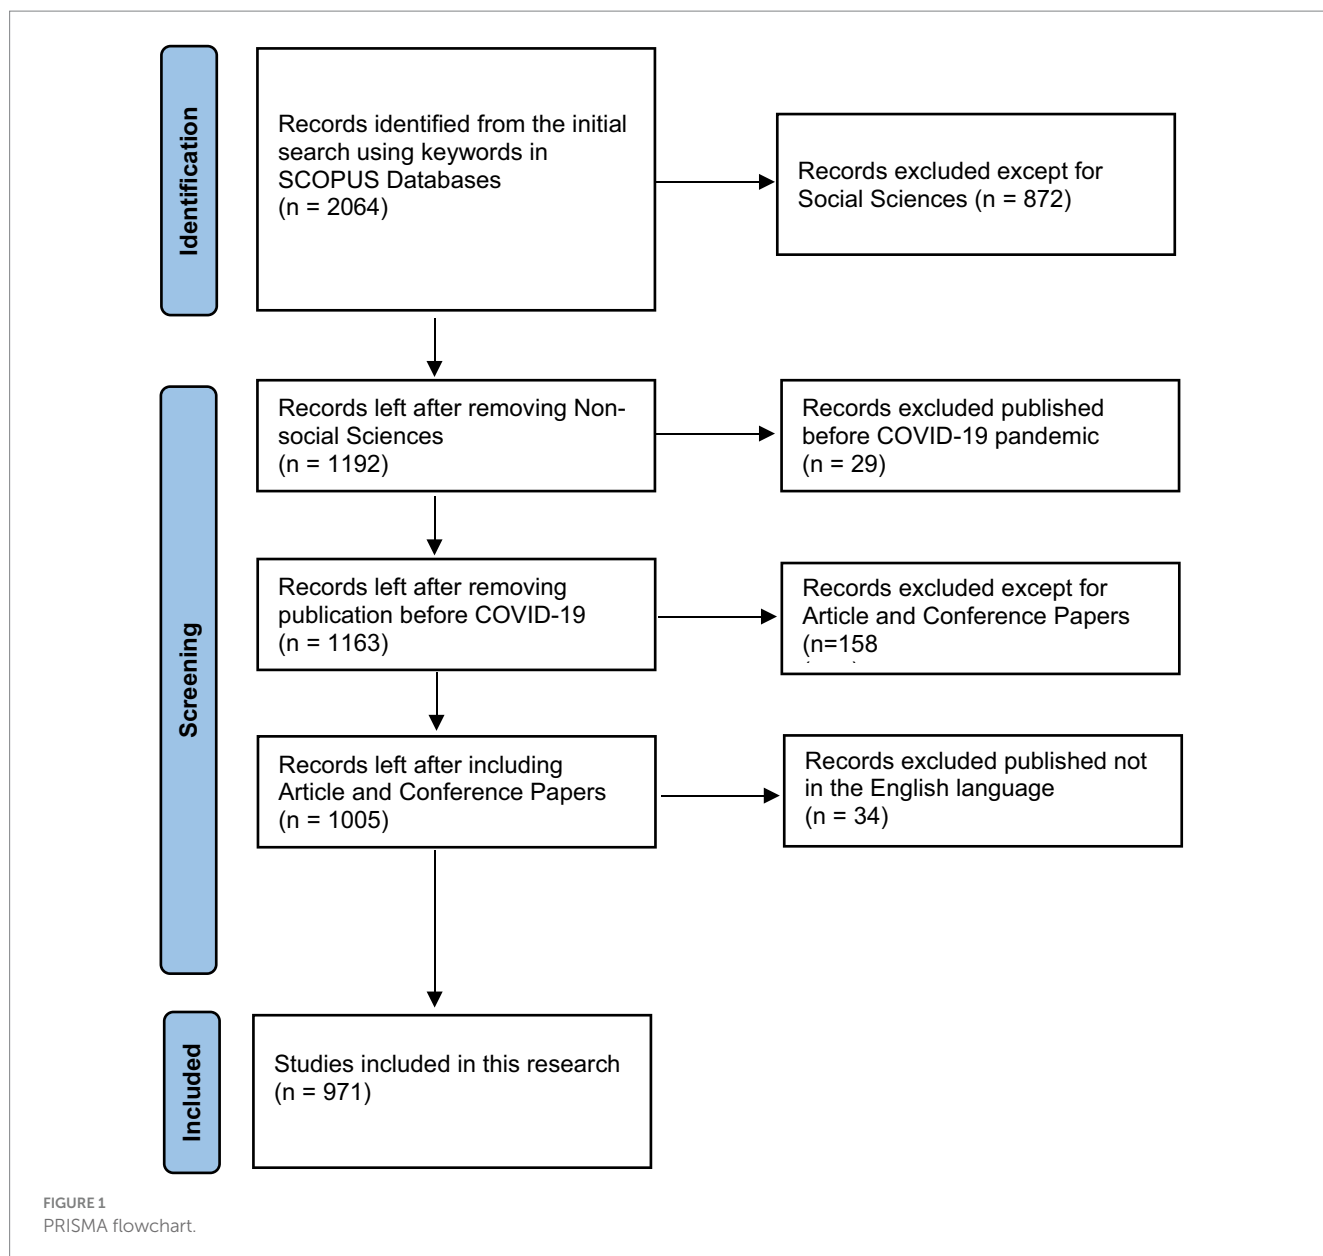

Distribution of publications by countries

Figure 2 illustrates the number of publications distributed by country. The results show that Brazil has 94 publications, Russia has 2 publications, India has 267 publications, China has 366, and South Africa has 254 publications. According to these results, China has the highest number of publications, while Russia has the lowest.

In addition, we identified an analysis of co-authorship among the BRICS countries. Figure 3 shows the relationships of co-authorship among the BRICS countries. The results from Figure 3 show that the authors from BRICS countries have specific relationships with their colleagues from other countries that are not placed among BRICS countries. Accordingly, researchers from China have relationships with Hong Kong, Malaysia, Taiwan, and Pakistan (green cluster). Researchers from South Africa collaborate with India, Nigeria, Ghana, and Saudi Arabia (red cluster). Researchers from Brazil have co-authorship with researchers from Australia, the United Kingdom, and the United States (blue cluster). These results show close collaborations between Indian and South African researchers. The results also show that Russian researchers did not have any collaborations with other countries.

Most influential journals

We analyzed the peer-reviewed journals that published the most articles on online learning regarding BRICS countries. Among 791 articles, most articles were published in the Sustainability journal ($n = 43$, see Table 3). The following journals published on online learning from BRICS countries are Perspectives in Education, with 34 publications, and Journal of Engineering Education Transformations, with 29 publications. A list of the top 10 journals published more on online learning is shown in Table 3. In addition, results showed that Education and Information Technologies is the journal with the

highest number of citations in the SCOPUS database. The following journal is a Sustainability journal with 602 citations.

Most influential authors

Table 4 presents the most influential authors who published online learning in higher education from the related countries. The results showed that Welsen is the author who published the highest number of articles, with five articles. The following authors, Bozkurt, Kandakatla, Mudau, Vijayalakshmi, and Yang, have four articles. Andrews, Ashraf, Aslam, and Bello follow these authors. Ashraf and Bozkurt are the two authors who have the most citations in the SCOPUS database.

We conducted a co-authorship analysis and involved the collaborations among the authors. We detected the authors who had published at least three articles in the dataset for this aim. The results from the co-authorship showed that there are a few collaborations

among the authors from BRICS countries. The results revealed 34 authors in 28 clusters. Although these authors had three articles regarding online learning, the results showed the existence of slight collaborations. Only a few authors co-authored the articles that were published. For example, Fouche and Adrews co-authored (red cluster, see Figure 4). The others are Bolaji and Bello (green cluster), Hasan and Mukherjee (yellow cluster), and Ximmeng and Yajuan (purple cluster). Figure 4 shows clusters of authors who work collaboratively on common literature emphasis areas.

Most influential documents

The results from Table 5 show that the studies by Dhawan (2020), Mishra et al. (2020), and Tumwesige (2020) are the first three. Based on these results, it can be concluded that these authors influenced the research on online learning in higher education. These researchers are

TABLE 2 The number of documents on online learning in the context of higher education.

Year	Number of publications
2020	84
2021	287
2022	310
2023	290

followed by Fornell and Larcker (1981), Braun and Clarke (2006), Hodges et al. (2020), Pokhrel and Chhetri (2021), Venkatesh et al. (2003), Ali (2020), and Davis (1989). Notably, the study of Fornell and Larcker (1981) is not from a different area than the education area but received the highest citations on online learning research. From the results in Table 5, another finding is that the studies are published in journals focused on education, except for the Journal of Marketing Research.

Research trends

We identified the keywords in research on online learning and higher education in BRICS countries. In this analysis, we searched the keywords used by researchers more than 20 times. The results from the keyword co-occurrence analysis are given in Figure 5. The results show the relationships among keywords. Also, these relationships present an idea regarding the patterns in the research on online learning in higher education in the related countries. The different colors in Figure 5 reveal the research clusters and provide evidence to determine research trends in online learning. The results revealed that e-learning, online learning, students, and teaching are central in the red cluster. Also, blended learning, online education, surveys, teaching-learning, learning systems, education computing, engineering education, computer-aided instruction, distance education and student engagement, and remote learning are around the red cluster. In the green cluster, COVID-19, the pandemic, learning, online education, and students are at the center. In addition, medical education, education, human, humans, medical students, cross-sectional study, education distance, distance learning, curriculum, India, China, and the internet are around the green cluster.

Discussion

This paper presents research trends examining online learning in higher education in BRICS countries after COVID-19. The results of the number of documents showed that there has been an increase in the amount of research on online learning in higher education. The results revealed that the highest number of publications was conducted in 2022. Our findings about this trend in the number of publications support the results of Aristovnik et al. (2023), Brika et al. (2022), Fauzi (2022), Küçük-Avci et al. (2022), and Zhang et al. (2022). For example, Küçük-Avci et al. (2022) concluded that the COVID-19 pandemic impacted higher education, increasing interest in e-learning and online learning in the post-pandemic period. As a result, the COVID-19 pandemic has significantly impacted students, instructors, and educational institutions worldwide, leading to a rapid shift to online learning modalities (Adnan, 2020;

Almazova et al., 2020; del Arco et al., 2021). Due to the pandemic, this sudden transition to online education has necessitated a thorough assessment of the benefits, limitations, and recommendations for the effectiveness of online learning (Almazova et al., 2020; Mukhtar et al., 2020). Furthermore, the disruption caused by the pandemic has led to a global reassessment of online education in higher education (Wang et al., 2022). This shift has necessitated research into higher education students' readiness for online learning and the effectiveness of online education platforms (Almazova et al., 2020; Chung et al., 2020). The pandemic has forced educators to adapt to online forms of teaching and learning quickly, leading to increased research on the challenges and opportunities of distance learning during emergencies (Alasmari, 2021; del Arco et al., 2021; Lee et al., 2021). Thus, the COVID-19 pandemic has accelerated the adoption of online learning in higher education, which has led to a surge in research to understand the impact, effectiveness, challenges, and opportunities associated with this shift (Moorhouse and Kohnke, 2021). Thus, the need to assess the impact of online learning during and after the pandemic has led researchers to investigate various aspects of online education to improve teaching and learning practices in higher education (Ramos-Pla et al., 2021).

The results showed that researchers from China and South Africa had the highest publications on online learning among BRICS countries. However, researchers in Russia had very few publications. This result is similar to those of Tlili et al. (2022). They found an increased trend in the countries contributing to Massive Open Online Courses research. They found that researchers from China and Spain showed more interest in MOOC research. In addition, this result is partly similar to those of Zhang et al. (2022), who have similar findings. Researchers from 103 countries worldwide examined diverse topics related to pandemic-induced online learning in the context of higher education. The results regarding the relationships of co-authorship among the BRICS countries revealed specific relationships of scholars with their colleagues from other countries that are not placed among BRICS countries. Only scholars from Indian and South African researchers collaborated closely. One reason for this result may be that the positive change in the production of scientific publications in South Africa reflects the willingness of the international community to collaborate with South African researchers (Sooryamoorthy, 2013). This openness to collaboration among South African researchers creates a favorable atmosphere for Indian and South African researchers to engage in joint online learning projects. Furthermore, the existing culture of collaboration among South African researchers and the positive reception of

TABLE 3 The top 10 peer-reviewed journals published articles on online education in higher education in BRICS countries.

Rank	Journals	Number of articles	Number of citations
1	Sustainability	43	602
2	Perspectives in Education	34	66
3	Journal of Engineering Education Transformations	29	74
4	BMC Medical Education	28	162
5	Education Sciences	25	381
6	Journal of Chemical Education	24	269
7	Education and Information Technologies	21	720
8	International Journal of Emerging Technologies in Learning	14	114
9	Interactive Learning Environments	13	283
10	Journal of Education and Health Promotion	13	46

international collaborations and partnerships in various fields provides a solid foundation for Indian and South African researchers to build close collaboration in online learning.

Another finding is that the results also show that Russian researchers did not have any collaborations with other countries. Various factors can make collaboration between Russian researchers and their colleagues difficult. As Hall et al. (2018) have noted, collaboration between scientists with overlapping areas of expertise can be difficult due to competition for resources. However, scientists with little overlap may have difficulty communicating effectively and aligning their goals. Another reason could be that the historical legacies and organizational challenges within the Russian science system, as discussed by Karaulova et al. (2016) and Oleksiyenko (2021), may also influence the dynamics of collaboration. These issues, combined with the individualistic nature of the research system, may contribute to Russian researchers' hesitation or challenges when engaging in collaborations.

The results about the most influential journals revealed that the Sustainability journal published more articles on online learning in higher education. The following journals are Perspectives in Education and Journal of Engineering Education Transformations. On the other hand, the results of the citations showed that Education and Information Technologies is the journal with the highest number of citations in the SCOPUS database. The following journal is a Sustainability journal. These results show that the peer-reviewed journals that have published articles for a long time may have the most published articles and citations. Additionally, high-quality research can attract more citations (Bornmann and Leydesdorff, 2017). In addition, articles published in high-ranking journals are more likely to be cited and thus contribute to the total number of citations in the journal (Kim et al., 2019). In particular, high-ranking journals attract more citations due to their trust and credibility. The journal's relevance and academic focus also affect citation rates, with publications with a strong academic focus receiving more citations. High citation rates in

peer-reviewed journals can be attributed to factors such as the quality of the research, the journal's reputation, editorial integrity, and the relevance of the content in citation rates.

Our results regarding co-authorship analysis who worked in BRICS countries revealed a few collaborations among the researchers

from BRICS countries. The results demonstrated slight collaborations among scholars in BRICS countries. The results regarding the most influential documents from co-citation analysis showed that the studies by [Dhawan \(2020\)](#), [Mishra et al. \(2020\)](#), and [Tumwesige \(2020\)](#) are cited by researchers who worked on online learning in higher education. The results of research trends revealed two lines of research. The first line of research has focused on e-learning, online learning, students, and teaching, which are central to the red cluster. Also, blended learning, online education, surveys, teaching-learning, learning systems, education computing, engineering education, computer-aided instruction, distance education and student engagement, and remote learning are around the red cluster. In the green cluster, COVID-19, the pandemic, learning, online education, and students are at the center. In addition, medical education, education, human, humans, medical students, cross-sectional study, education distance, distance learning, curriculum, India, China, and the internet are around the green cluster.

Conclusion

This paper aims to analyze current research trends on online learning in higher education in BRICS countries post-COVID-19. The

significant increase in online course offerings, digital literacy initiatives, and cross-institutional collaboration to improve the quality of online education. The findings provide researchers with a basis for recognizing the current state of research and identifying any shortcomings of previous studies. It highlights areas for further investigation, such as the impact of online learning on student engagement and outcomes, the effectiveness of different instructional designs, and the long-term sustainability of online programs. In addition, the study highlights the need for continued research to monitor the development of online education and its impact on the global educational landscape, particularly in developing countries with growing internet penetration and digital infrastructure.

Recommendations

The bibliometric study offers potential pathways for future research. Future bibliometric studies should focus on conducting detailed analyses of the areas that have shown significant relevance for online learning post-pandemic. This will help utilize innovative and technological tools for higher education teaching, student well-being, and professional development. An in-depth analysis of these areas could provide valuable insights into the respective future areas to improve researchers' understanding of the impact of online learning post-pandemic. Additionally, content analysis may provide a more detailed understanding of scientific discourse by exploring topics and contexts in bibliometric studies. Moreover, conducting future analyses and comparisons would be beneficial in exploring the differences between countries with different social and educational contexts. Such an analysis can reveal different and similar patterns based on the educational contexts of different groups of countries concerning online learning amidst the pandemic. Collaboration and information sharing between countries can be improved by analyzing their differences. This could be further enriched by including multidisciplinary perspectives, including psychological, sociological, and technological viewpoints, to create a comprehensive framework that reflects the multi-faceted nature of online learning. Interdisciplinary collaboration could also uncover new dimensions of online education that have not yet been adequately explored, such as the impact of cultural nuances on the acceptance and effectiveness of online learning tools.

Longitudinal studies could also help understand the development of online learning trends. These studies would track changes over time and provide a dynamic view of online education's development and long-term outcomes. Such longitudinal research could also identify which educational practices introduced during the pandemic have become integral to the educational landscape. In conclusion, future bibliometric studies should not only seek to capture existing research but also identify gaps and emerging trends. This could guide policymakers, educators, and researchers in navigating the post-pandemic education field. The insights gained from these studies could guide the development of robust, inclusive, and effective online learning environments tailored to a global student population with diverse needs and backgrounds in higher education. The COVID-19 pandemic has led to significant changes in higher education. Nevertheless, it has also sped up the integration of online learning tools in education. The online learning methods created during the pandemic remain pertinent and beneficial for future education.

Hence, researchers and institutions should try to enhance student engagement in online learning to be flexible to changing student requirements.

Limitations

It is worth noting that only articles from journals listed in the Scopus database were considered in this study. Other databases, such as ProQuest, Science Direct, and Web of Science, could be used in future studies to obtain a more comprehensive analysis. Furthermore, the bibliometric analysis has certain limitations as it only considers metadata and not the actual content of the documents. The content analysis could address this limitation in future bibliometric studies. One of our study's limitations could be the authors' judgment in determining the keywords for this study. To overcome this limitation, we attempted to include all related keywords to online learning, higher education, and COVID-19 to ensure a broad coverage of relevant literature. Furthermore, an algorithmic approach to keyword selection could be developed to improve objectivity and reproducibility. There may have been a limited number of keywords in some publications, making it difficult to accurately interpret the article's content when examining the co-occurrence of keywords. This could be mitigated in future research by using advanced text mining and natural language processing techniques to extract topics even when no explicit keywords are given.
