## A Corrigendum on

### Climate Change Impacts the Protective Effect of Forests: A Case Study in Switzerland

by Moos, C., Guisan, A., Randin, C. F., and Lischke, H. (2021). *Front. For. Glob. Change* 4:682923. doi: 10.3389/ffgc.2021.682923

In the original article, there was a mistake in **Figure 8** as published. **The published figure shows the basal area per elevation level and main species in 50 years, and not in 150 years.** The corrected **Figure 8** appears below.

In the original article, there was an error. **It was stated in the result that currently, a block with a volume between 0.1 and 0.5 m<sup>3</sup> is expected to reach the railway about once in 100 years. In future, its occurrence frequency could increase to once in 30 years. However, currently, the occurrence frequency is about once in 10 years and in future it could increase to once in 3 years.**

A correction has been made to **Results, Protective Effect of Forest, Paragraph 3:**

**Currently, a block with a volume between 0.1 and 0.5 m<sup>3</sup> is expected to reach the railway about once in 10 years. In future, its occurrence frequency could increase to once in 3 years (Figure 11).**

The authors apologize for this error and state that this does not change the scientific conclusions of the article in any way. The original article has been updated.
