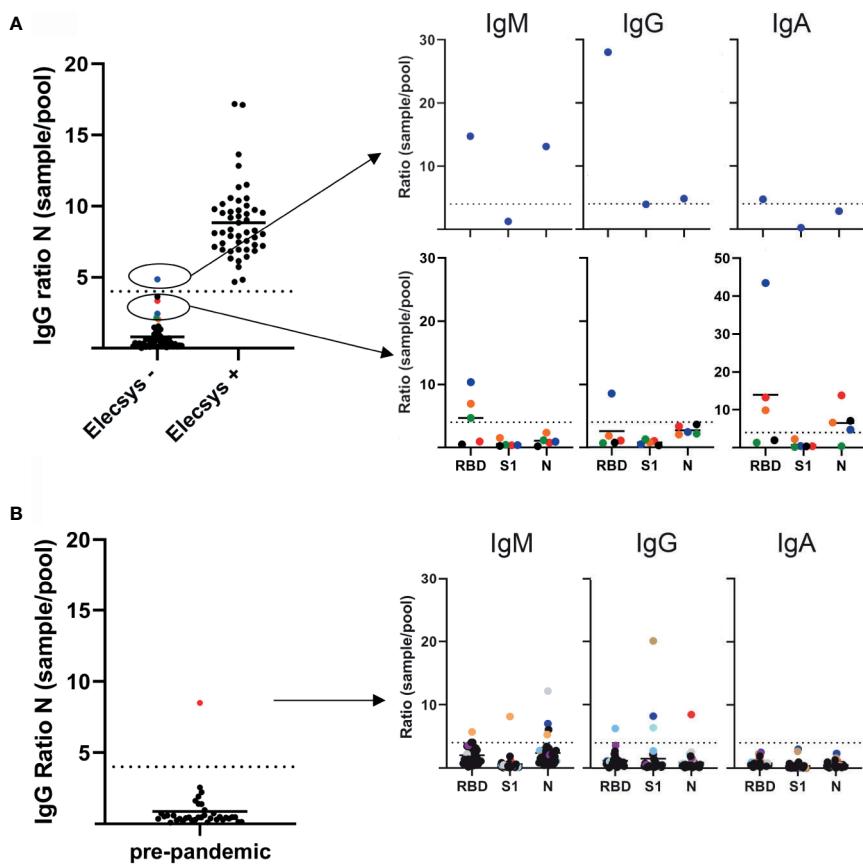

FIGURE 1 | SARS-CoV-2 antibody levels as measured by a multiplex based assay and calibrated against the Elecsys® Anti-SARS-CoV-2 assay (Roche diagnostics). **(A)** 100 serum samples previously analyzed by Elecsys® assay (depicted on the x axis as negative and positive), were received from the Department of Clinical Microbiology, and SARS-CoV-2 IgG antibodies against the N protein were analyzed blindly by multiplex (left panel). Right top panel depicts the single sample that had a SARS-CoV-2 IgG >4 sample/pool ratio for the N protein. Bottom right panel depicts the samples that showed a >2 but <4 sample/pool ratio by multiplex. **(B)** Left panel depicts 36 serum samples received in 2019 by the Department of Immunology. SARS-CoV-2 IgG antibodies against the N protein were analyzed by multiplex. Right panel depicts the serum/pool ratio of the serum samples against RBD, S1 and N proteins. Samples above the cut-off level are color coded.
