KEYWORDS

Pomacentridae, demersal zooplankton, mutualism, indirect effects, cleaning symbiosis,
planktivorous fish, coral reef trophic ecology

A Corrigendum on

**Cleaner fish *Labroides dimidiatus* presence does not indirectly affect
demersal zooplankton**

by Grutter A.S., Nishikawa N., Uribe Palomino J., Richardson A.J. (2022). *Front. Mar. Sci.* 9:1-17,
doi: 10.3389/fmars.2022.812989

Error in Figure/Table

In the published article, there was an error in [Table 1](#) as published. The column headings were incorrect. The corrected [Table 1](#) and its caption appear below.

The authors apologize for this error and state that this does not change the scientific conclusions of the article in any way. The original article has been updated.

TABLE 1 Summary of results for fish abundance, diversity, and community composition in relation to the effect of cleaner fish *Labroides dimidiatus* treatment (presence or absence) reef⁻¹ and or their interactions with other factors (Supplementary Tables 4, 5).

Response measured	Casuarina Beach		Lagoon		Cleaner presence effect	P
	2009	2012	2009	2012		
Total abundance	+		+		C × Y	0.0491 [§]
<i>Pomacentrus amboinensis</i>	+	+	+	+	C	0.0012 [§]
<i>P. moluccensis</i>					C	0.2779 [§]
<i>P. nagasakiensis</i>					C	0.2905 [§]
Species richness					C	0.3100
Shannon diversity index					C	0.5111
Community composition					C	All > 0.05

“+” represents an increase in the diversity or abundance on reefs with cleaners (no significant decreases were detected); “C × Y” represents an interaction between cleaner treatment and year, and “C” represents cleaner treatment. Data are compared with the baseline (control reefs with cleaners, the Casuarina Beach site, and year 2009). §=The Šidák correction for four multiple tests was applied ($\alpha = 0.0127$).
