## A corrigendum on

Epistemic trust and personality functioning mediate the association between adverse childhood experiences and posttraumatic stress disorder and complex posttraumatic stress disorder in adulthood

by Kampling H, Kruse J, Lampe A, Nolte T, Hettich N, Brähler E, Sachser C, Fegert JM, Gingelmaier S, Fonagy P, Krakau L, Zara S and Riedl D (2022). *Front. Psychiatry* 13:919191. doi: 10.3389/fpsyt.2022.919191

In the published article, there was an error. The prevalence rates for PTSD and CPTSD were not correctly printed.

A correction has been made to the **Results** section, *Prevalence and association of adverse childhood experiences and posttraumatic stress disorder as well as complex posttraumatic stress disorder in adulthood*, Paragraph 1.

This sentence previously stated:

“The rates for PTSD and cPTSD symptoms above the cut-off were quite similar with a prevalence of 4.4% (n = 88) and 4.1% (n = 83) respectively.”

The corrected sentence appears below:

“The rates for PTSD and cPTSD symptoms above the cut-off were quite similar with a prevalence of 1.4% (n = 29) and 2.5% (n = 51) respectively.”

A correction has been made to the **Discussion** section, Paragraph 1.

This sentence previously stated:

“Our results show that a third of our sample suffer from ACEs (about 24% had one to three and about 11% four or more ACEs), and about 4.1% and 4.4% fulfilled self-reported PTSD and cPTSD criteria respectively.”

The corrected sentence appears below:

“Our results show that a third of our sample suffer from ACEs (about 24% had one to three and about 11% four or more ACEs), and about 2.5% and 1.4% fulfilled self-reported PTSD and cPTSD criteria respectively.”

The authors apologize for this error and state that this does not change the scientific conclusions of the article in any way. The original article has been updated.
